Property Location
12711 Milan Way, Bowie, Maryland 20715

Date of Inspection 1/9/2019

Prepared By: Vinny Gigliotti
Certified Indoor Environmentalist (CIE)
Dear Sam,

The results of the post remediation inspection and testing performed at Chapel Forge Early Childhood Center, located at 12711 Milan Way, Bowie, Maryland 20715, are concluded and the findings are enclosed. I want to thank you for allowing ESI the opportunity to service your indoor environmental needs.

Included in this report are the observations, instrument readings, lab results, and recommendations for any areas inspected and/or tested that need additional cleaning or remediations. Several photographs illustrating the problematic conditions are attached.

**Background Information**
The school was first inspected and tested on 12/5/2018, and ESI returned to the school on 1/9/19 to conduct a post remediation inspection and testing. The purpose of this post remediation inspection and testing is to determine if the areas remediated were properly cleaned and that no health or environmental risk are present. If any problematic conditions are detected, ESI will make recommendations for corrective actions to be implemented by the PGCPS Environmental Team.

**Observations and instrument readings**

</tr>
</tbody>
</table>

**Observations**
- There were NO signs of mold growth or elevated levels of moisture detected within this location.
- The HVAC registers were cleaned, but rust was still evident.
- The green carpet was not removed, but it was cleaned, and the curtain wall was removed, as this was an area of concern because the teacher indicated that it smelled.
- The remediation and cleaning efforts were completed successfully, and the indoor air quality should pose no health or environmental risk.
- The total spore count in this room went from 1,920 spores per cubic meter to only 160.

**Recommendations**
NONE

**Observations**
- There were NO signs of mold growth or elevated levels of moisture detected within this location.
- The remediation and cleaning efforts were completed successfully, and the indoor air quality should pose no health or environmental risk.
- Two of the HVAC ceiling registers and surrounding ceiling tile grids are rusted. This is an indication of condensation within the ducts. No mold was detected during the time of this inspection, but the condensation may become problematic in the spring and summer months.

**Recommendations**
NONE
### Observations

- There were NO signs of mold growth or elevated levels of moisture detected within this location.
- The remediation and cleaning efforts were completed successfully, and the indoor air quality should pose no health or environmental risk.
- The occupants of this office space are experiencing physical discomfort because the thermostat is not properly regulating the HVAC.
- The total spore count in this room went from 3,480 spores per cubic meter to only 640.

**Recommendations**

A mechanical HVAC technician should inspect the HVAC system for the Main Office area.

### Observations

- There was a small section of visible mold growth under one of the U-shape tables that was missed during the remediation efforts. However, the onsite PGCPS Environmental personal (Cedric) cleaned / removed it with a bleach and water solution.
- The indoor air quality should pose no health or environmental risk.

**Recommendations**

NONE

### Observations

- There were NO signs of mold growth or elevated levels of moisture detected within this location.
- The remediation and cleaning efforts were completed successfully, and the indoor air quality should pose no health or environmental risk.

**Recommendations**

NONE

### Observations

- There were NO signs of mold growth or elevated levels of moisture detected within this location.
- The remediation and cleaning efforts were completed successfully, and the indoor air quality should pose no health or environmental risk.

**Recommendations**

NONE
Conclusions

Once I concluded the visual inspection and didn’t see any residual mold growth or contributing factors as to why mold would recolonize, I collected indoor air quality samples of microbial and biological contaminates to be analyzed by an independent laboratory. The samples in this report indicate a normal fungal ecology for the specific locations tested. Therefore, the indoor air quality passed, and based on the visual inspection and the lab results, there are no health or environmental risk related to the remediation areas of the school. (Please refer to the attached lab results below for identification and spore count per location.)

I hope you found our service beneficial. If you have any questions or concerns, please feel free to contact me at 301-509-0010 which my cell phone and or call my office at 410-867-6262.

Respectfully,

Vinny Gigliotti (CIE)
Environmental Solutions, Inc.
Interpretation of Lab Results

In the enclosed Air Cassette Analysis report, you will notice Fungal Identification, which is the species detected in the breathable airspace inside, and outside. The Raw count is the actual number of spores counted on the slide, and the Count/m³ are the spores per cubic meter of air. The other particles are non-living particles such as dander, mycelial fragments, pollens, etc…

In order for humans to be exposed indoors, fungal spores, fragments, or metabolites must be released into the air and inhaled, physically contacted (dermal exposure), or ingested. Whether symptoms develop in people exposed to fungi depends on the nature of the fungal material (e.g., allergenic, toxic, or infectious), the amount of exposure, and the susceptibility of exposed persons.

Susceptibility varies with genetic predisposition (e.g., allergic reactions do not always occur in all individuals), age, state of health, and concurrent exposures.

Organism Descriptions

The descriptions of the organisms presented are derived from various reference materials. The laboratory report is based on the data derived from the samples submitted and no interpretation of the data as to potential or actual health effects resulting from exposure to the numbers of organisms found, can be made by laboratory personnel. Any interpretation of the potential health effects of the presence of this organism must be made by qualified professional personnel with first hand knowledge of the sample site, and the problems associated with that site.

Dander - Comprised of human and/or animal skin cells. Counts may be higher in carpeted rooms and in rooms with more traffic. Health Effects: May cause allergies.

Fibers - This category can include clothing, carpet, and insulation fibers.

Ascospores - From the fungal Subphylum Ascomycotina. Ascospores are ubiquitous in nature and are commonly found in the outdoor environment. This class contains the "sac fungi" and yeasts. Some ascospores can be identified by spore morphology; however, some care should be exercised with regard to specific identification. They are identified on tape lifts and non-viable analysis by the fact that they have no attachment scars and are sometimes enclosed in sheaths with or without sacs. Ascomycetes may develop both sexual and asexual stages. Rain and high humidity may help asci to release, and disperse ascospores, which is why during these weather conditions there is a great increase in counts. Health Effects: This group contains possible allergens.

Aspergillus/Penicillium - These spores are easily aerosolized. Only through the visualization of reproductive structures can the genera be distinguished. Also included in this group are the spores of the genera Acremonium, Phialophora, Verticillium, Paecilomyces, etc. Small, round spores of this group lack the necessary distinguishing characteristics when seen on non-viable examination. Health Effects: Can cause a variety of symptoms including allergic reactions. Most symptoms occur if the individual is immunocompromised in some way (HIV, cancer, etc). Both Penicillium and Aspergillus spores share similar morphology on non-viable analysis and therefore are lumped together into the same group.

Basidiospores - From the Subphylum Basidiomycotina which contains the mushrooms, shelf fungi, and a variety of other macrofungi. They are saprobiotic, endomycorrhizal fungi or agents of wood rot, which may destroy the structure wood of buildings. It is extremely difficult to identify a specific genera of mushrooms by using standard culture plate techniques. Some basidiomycete spores can be identified by spore morphology; however, some care should be exercised with regard to specific identification. The release of basidiospores is dependant upon moisture, and they are dispersed by wind. Health Effects: May have the potential to produce a variety of toxins. Members of this group may trigger Type I and III fungal hypersensitivity reactions. Rarely reported as opportunistic pathogens.

Cladosporium species - The most commonly identified outdoor fungus. The outdoor numbers are reduced in the winter and are often high in the summer. Often found indoors in numbers less than outdoor numbers. It is commonly found on the surface of fiberglass duct liner in the interior of supply ducts. A wide variety of plants are food sources for this fungus. It is found on dead plants, woody plants, food, straw, soil, paint and textiles. Often found in dirty refrigerators and especially in reservoirs where condensation is collected, on moist window frames it can easily be seen covering the whole painted area with a velvety olive green layer. Health Effects: It is a common allergen. It can cause mycosis. Common cause of extrinsic asthma (immediate-type hypersensitivity; type I). Acute symptoms include edema and bronchospasms, chronic cases may develop pulmonary emphysema. Illnesses caused by this genus can include phaeohyphomycosis, chromoblastomycosis, hay fever and common allergies.

Organism Descriptions

The descriptions of the organisms presented are derived from various reference materials. The laboratory report is based on the data derived from the samples submitted and no interpretation of the data, as to potential, or actual, health effects resulting from exposure to the numbers of organisms found, can be made by laboratory personnel. Any interpretation of the potential health effects of the presence of this organism must be made by qualified professional personnel with first hand knowledge of the sample site, and the problems associated with that site.

Curvularia species - Curvularia is found on plant material and is considered a saprobe. It has also been isolated from dust samples and from wallpaper.

**Health Effects:** It has been reported to cause type I hypersensitivity and to be a cause of allergic fungal sinusitis. It may cause corneal infections, mycetoma and infections in immune compromised hosts.

Smuts/Myxomycetes - Smuts and Myxomycetes are parasitic plant pathogens. They are typically grouped together due to their association with plants, the outdoors and because they share similar microscopic morphology.

**Health Effects:** Can produce type I fungal hypersensitivity reactions.

Ulocladium species - Isolated from soil, dead plants and cellulose materials. Found on textiles. It can be found on many types of materials, but mostly found on decaying materials. Has a greater water activity need for growth and is therefore considered a water indicator organism.

**Health Effects:** Reported to be a major allergen. Rarely causes subcutaneous infections in humans. It has a high water requirement.

Industry References

Since the 1993 New York City Department of Health (NYCDOH) document (Assessment and remediation of Stachybotrys Atra in Indoor Environments) was produced, several other guidance documents have been written. This report was developed in accordance with and including:

- **Control of Moisture Problems Affecting Biological Indoor Air Quality** (Flannigan and Morey, 1996).
- **Bioaerosols: Assessment and Control** (American Conference of Government Industrial Hygienists [ACGIH], 1999).
