Prince George's County Public Schools 13300 Old Marlboro Pike Upper Marlboro, Maryland 20772 Attention: Mr. Alex Baylor

RE: Indoor Air Quality Assessment, James McHenry Elementary School

IFB: 022-19

ATI Project Number: 20-685

Dear Mr. Baylor:

Prince George's County Public Schools requested that ATI, Inc., conduct a proactive indoor air quality (IAQ) assessment at James McHenry Elementary School on November 30, 2020. The key findings are enclosed in the Executive Summary on page one, and the official laboratory report for total fungal spore trap sampling is enclosed in Appendix A.

Thank you for the opportunity to provide Industrial Hygiene services for Prince George's County Public Schools. If you have any questions regarding this report, please contact us at (202) 643-4283.

Sincerely, ATI, INC.

Courtney E. McCall Project Manager

1 Executive Summary

ATI conducted a proactive Indoor Air Quality (IAQ) assessment on November 30, 2020, at James McHenry Elementary School, located at 8909 McHenry Lane, Lanham, MD 20706.

The assessment included a visual assessment of randomly selected classrooms and other frequently occupied spaces, such as the cafeteria, the main office, and classrooms, for potential IAQ contributors and pathways. As part of the assessment, ATI measured common IAQ comfort parameters using direct reading instruments, including temperature, relative humidity, carbon dioxide, and carbon monoxide. Also, ATI collected total fungal air samples on spore trap cassettes for microbiological analysis.

The following is a summary of the key findings from this assessment:

- 1. Two of the tested spaces were warmer than the ASHRAE recommended winter range of 68-75°F.
- 2. The relative humidity in all tested spaces were less than the ASHRAE maximum relative humidity guidelines of 65%.
- 3. Carbon dioxide concentrations in all tested spaces were less than the ASHRAE limit for carbon dioxide, which was 1,107 parts per million (PPM) for the day of the assessment.
- 4. Carbon monoxide concentrations were less than the IAQ meter's detection limit throughout the tested spaces.
- 5. The fungal spore trap results do not suggest indoor spore amplification in the assessed spaces and are not considered unusual. While the concentration of *Aspergillus/Penicillium* in the Main Office exceeded the ambient concentration, this is not considered unusual indoors.

2 Assessment Methods

Mikal Frater of ATI, Inc., conducted a visual assessment and air sampling on November 30, 2020. Sampled rooms were randomly selected and accounted for approximately 10% of classrooms or a minimum of five samples. Ms. Frater documented visual observations at the time she collected the air samples. ATI references the American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) *Standard 62.1 – 2016* and ASHRAE *Standard 55 – 2017* when providing IAQ services to clients. ASHRAE is an industry leader on energy efficiency and indoor air quality.

All measurements and air samples were collected between three-six feet from floor elevation, which represents a typical breathing zone, and away from air-supply and return diffusers. Real-time direct readings for temperature, relative humidity, carbon dioxide (CO₂), and carbon monoxide (CO), were measured with a calibrated TSI Q-Trak 7575-X Meter and attached 982 Probe.

Total fungal air samples were collected with a Buck BioAire High-Volume Sampling Pump on Zefon Air-O-Cell spore-trap cassettes at a flow rate of 15 liters per minute for five minutes, for a sample volume of 75 liters. EMSL Analytical, Inc. of Beltsville, MD analyzed the samples using direct microscopic examination per ASTM D7391-09, which counts both viable and non-viable mold spores and particulates, which combined yields *total fungal* results. EMSL participates in the National Institute of Standards and Technology's (NIST) National Voluntary Laboratory Accreditation Program (NVLAP) for general laboratory performance and management, and the American Industrial Hygiene Association (AIHA) for Environmental Microbial Laboratory Accreditation Program (EMLAP). The EMSL laboratory reports are included in Appendix A.

3 Visual Observations

Table 1 lists the areas, conditions, observations, and other pertinent details related to this IAQ assessment. On the date of the sampling event, few occupants were present in the school because of the COVID-19 global pandemic.

Table 1: Visual Observations and Sampling Locations

Sample Location	Observations
Outdoors	 Light rain Cloudy skies No foot or vehicle traffic during sampling
Main Office	 There are two wall units that are ON during sampling and providing heat to the area. There are three occupants in the room during sampling The door to the main corridor is open during sampling Space is approximately 390 ft.²
Room 8	 There are no stained ceiling tiles, noticeable odors, or visible mold growth. There is one A/C unit in this room – an older Friedrich unit with trace dust load There is one occupant in the room during sampling Space is approximately 750 ft.²
"Computer Lab" Room 1	 There is a new Friedrich A/C unit with improved insulation since previous assessment was conducted There is one wall unit supplying heat that spans the length of the room, Space is approximately 720 ft.²
Room A4	 There is one return air supply and four air diffusers in this room. There are no stained ceiling tiles, noticeable odors, or visible mold growth. Space is approximately 820 ft.²
Room 19	 Two A/C units – older Freidrich models – one unit is missing a front cover, while the other unit is taped up. Both units are OFF and have accumulated a trace dust load. One occupant in room during sampling As noted in previous report, sink faucet is still leaking Space is approximately 690 ft.²

4 Thermal Environmental Conditions for Human Occupancy

ASHRAE Standard 55-2017, Thermal Environmental Conditions for Human Occupancy, addresses thermal comfort in an office environment, which means that an employee wearing a normal amount of clothing feels neither too cold nor too warm. This standard discusses thermal comfort within the context of air temperature, humidity, and air movement and provides recommended ranges for temperature and humidity that are intended to satisfy 80% of occupants. The recommended ASHRAE ranges are referenced below by each comfort parameter.

4.1 Temperature

The ASHRAE standard establishes a winter comfort range of between 68°F and 75°F and a summer range of between 73°F and 79°F. The temperatures measured during the November 30, 2020, assessment are summarized in Table 2. As indicated by the data

in the table, temperatures in the school averaged between 72°F and 77°F, with two locations slightly warmer than the ASHRAE recommended winter range.

11/30/2020 **ASHRAE** ٥F **Sample Location Standard** ۰F Min Max **Average** 63 65 64 N/A Outdoors Indoors Main Office 73 75 74 68-75°F 68-75°F Room 8 76 76 76 "Computer Lab" Room 1 68-75°F 77 77 77 Room A4 71 72 72 68-75°F Room 19 73 73 73 68-75°F

Table 2: Temperature Measurements

4.2 Relative Humidity

Relative humidity is a key factor for mold growth. Mold has the potential of growing on suitable surfaces with humidity levels greater than 65%. ASHRAE *Standard 62.1-2016*, *Ventilation for Acceptable Indoor Air Quality*, recommends a maximum indoor relative humidity of 65% to prevent condensation of moisture on surfaces. Relative humidity less than 30% may result in drying of occupants' mucous membranes and skin. Relative humidity measurements are summarized in Table 3. As indicated by the data in the table, average relative humidity ranged between 38 and 64% with all locations falling less than the ASHRAE maximum recommendation of 65% relative humidity.

11/30/2020 **ASHRAE** (% RH) **Sample Location Standard** (% RH) Min Max **Average** Outdoors 78 81 N/A **Indoors** Main Office < 65 61 66 64 Room 8 37 39 38 < 65 "Computer Lab" Room 1 42 42 42 < 65 Room A4 43 44 44 < 65 Room 19 44 46 45 < 65

Table 3: Relative Humidity Measurements

4.3 Carbon Dioxide

Carbon dioxide concentrations within an occupied building are a standard method used to gauge the efficiency of ventilation systems. Carbon dioxide is a by-product of human respiration and does not pose an acute health hazard alone. Elevated concentrations may suggest that insufficient fresh air is being supplied to an occupied space and/or that the ventilation system does not provide a sufficient rate of air exchange.

Research has indicated that buildings with adequately operating ventilation systems are able to remove odors generated by activities in an indoor office environment efficiently. ASHRAE *Standard 62.1-2016* states that comfort (odor) criteria with respect to human bioeffluents are likely to be satisfied if the ventilation can maintain indoor carbon dioxide concentrations less than 700 parts per million (ppm) greater than the outdoor air concentration. Typically, outdoor carbon dioxide concentrations range from 300 ppm to 450 ppm, with the higher range typically found in urban areas during peak rush hour.

Carbon dioxide concentrations are summarized in Table 4. On the day of the assessment, the average outdoor carbon dioxide concentration was 407 ppm, which calculates to a maximum indoor concentration of 1,107 ppm (700 + 407). All tested locations indoors were less than the recommended maximum for the day of the assessment.

11/30/2020 **ASHRAE** Concentration (parts per million) **Standard** Sample Location (mgg) Min Max **Average** NTE Outdoors 393 420 407 N/A Indoors Main Office 411 419 415 1.107 Room 8 469 631 550 1.107 "Computer Lab" Room 1 440 440 440 1,107 Room A4 440 456 448 1,107 Room 19 457 457 457 1.107

Table 4: Carbon Dioxide Measurements

4.4 Carbon Monoxide

Carbon monoxide is a colorless and odorless gas produced by the incomplete combustion of carbon containing fuels. Oil, gasoline, diesel fuels, wood, coke, and coal are the major sources of carbon monoxide. ASHRAE recommends that carbon monoxide not exceed nine ppm indoors over an eight-hour time-weighted average. ATI measured carbon monoxide concentrations using a TSI Q-Trak model number 7575-X with an attached IAQ probe (model number 982). The instrument's carbon monoxide sensor has an error range of \pm 3% of the reading or three (3) ppm, whichever is greater. As indicated by the data in Table 5, carbon monoxide concentrations were less than the Q-Trak's detection limit throughout the school.

11/30/2020 **ASHRAE** Concentration (parts per million) Sample Location **Standard** (ppm) Min Max **Average** Outdoors <3 <3 N/A Inside Main Office <3 <3 < 9 <3 Room 8 <3 <3 <3 < 9 "Computer Lab" Room 1 < 9 <3 <3 <3 Room A4 <3 <3 <3 < 9 Room 19 <3 <3 <3 < 9

Table 5: Carbon Monoxide Measurements

5 Total Fungal Air Sampling Results

Mold can be carried indoors through building entrances, open windows, loading docks, foot traffic into buildings, and the HVAC system. To thrive indoors, mold requires a food source, proper temperature and humidity or water to foster its growth. The November 30, 2020 mold assessment sampled air using spore trap cassettes in randomly selected classrooms and other areas throughout the facility. These cassettes collect both viable spores, those capable of producing more fungal colonies, and non-viable spores, which cannot reproduce. Based upon recognized industry practices, indoor mold concentrations are compared with those detected outdoors, which are also known as ambient or baseline samples.

In normal circumstances, the diversity of spores identified indoors and outdoors should be similar with some exceptions. The high concentration of one or two species of fungal spores identified indoors and the absence of the same species outdoors can indicate a moisture problem with the potential to degrade the air quality. Fungi species present indoors are typically found at levels ranging from approximately 10-50% of their levels in the outdoor air, reflecting the filtering by the building's HVAC system.

The indoor concentrations were generally favorable compared to the outdoor concentrations. The total ambient spore concentration was 73,340 counts/m³, and no tested space had a total spore concentration that exceeded the outdoor ambient concentration. The *Aspergillus/Penicillium* concentration in the Main Office was 510 counts/m³, compared with the ambient sample of 100 counts/m³; however, this is not considered unusual indoors and does not suggest active indoor mold growth. *Aspergillus/Penicillium* is known to cause allergic reactions in certain people, albeit in higher concentrations.

The spore concentrations in all indoor sampled rooms are not considered unusual for an occupied space like a school, but total spore concentrations greater than 1,000 counts/m³ may suggest unfiltered outdoor air is entering the space, such as through opened windows or doors, or fresh air is bypassing the filtration units of the HVAC systems. Insufficient housekeeping may also allow unusual outdoor fungal spores to accumulate in indoor spaces.

The official laboratory report with spore trap samples collected on November 30, 2020, is presented in Appendix A.

6 Summary of Findings

- 1. Two of the tested spaces were warmer than the ASHRAE recommended winter range of 68-75°F.
- 2. The relative humidity in all tested spaces were less than the ASHRAE maximum relative humidity guidelines of 65%.
- 3. Carbon dioxide concentrations in all tested spaces were less than the ASHRAE limit for carbon dioxide, which was 1,107 parts per million (PPM) for the day of the assessment.
- 4. Carbon monoxide concentrations were less than the IAQ meter's detection limit throughout the tested spaces.
- 5. The fungal spore trap results do not suggest indoor spore amplification in the assessed spaces and are not considered unusual. While the concentration of *Aspergillus/Penicillium* in the Main Office exceeded the ambient concentration, this is not considered unusual indoors.

We appreciate the opportunity to provide these IAQ testing services for you. If you have any questions, please contact us at (202) 643-4283.

Best,

EMSL maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This report relates only to the samples reported above, and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted. High levels of background particulate can obscure spores and other particulates, leading to underestimation. Background levels of 5 indicate an overloading of background particulates, prohibiting accurate detection and quantification. Present = Spores detected on overloaded samples. Results are not blank corrected unless otherwise noted. The detection limit is equal to one fungal spore, structure, pollen, fiber particle or insect fragment. "*" Denotes particles found at 300X. "." Denotes not detected. Due to method stopping rules, raw counts in excess of 100 are extrapolated based on the percentage analyzed.

Samples analyzed by EMSL Analytical, Inc. Plymouth Meeting, PA AIHA-LAP, LLC-EMLAP Accredited #178659

Certificate of Calibration

(✓ Buck™ BioAire Pump Calibration Rotameter

() Buck™ BioSlide Pump Calibration Rotameter

Serial number: R14536 Date Calibrated: $\frac{12/27/19}{27/29}$ Calibration Due Date: $\frac{12/27/29}{29}$

Flow Calibration

This is to certify that the rotameter listed above has been calibrated using a Buck Primary calibrator listed below which is calibrated according to A.P. Buck, Inc. calibration procedure APB-1, Ver. 6.2 and is traceable to the National Institute of Standards & Technology (N.I.S.T). A.P. Buck guarantees the accuracy of the rotameter to be within \pm 5% of the actual flow rate.

AMBIENT CONDITIONS: Temperature 74±3° F Relative Humidity 50±10%
